

# Occupancy monitor

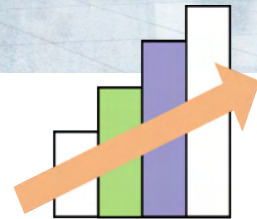

## Monitor

With real-time overview on different levels

## Protect

Keep the office a safe place to work

## Optimize

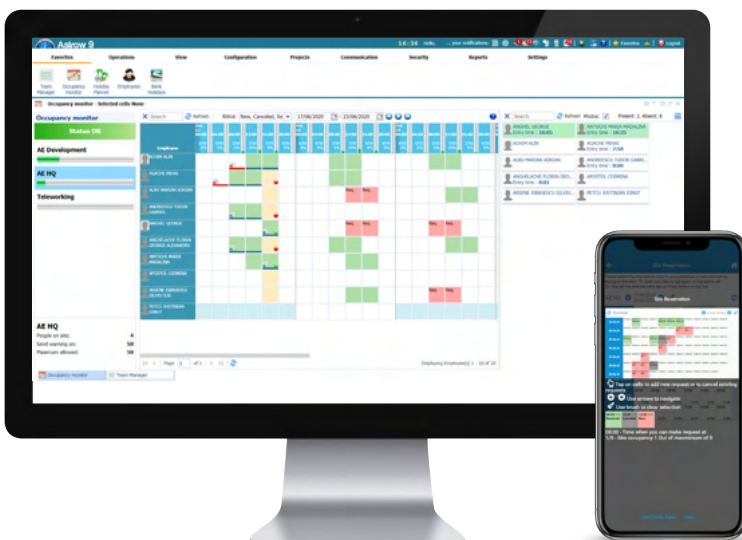

reduce costs by adapting to new standards

## BECAUSE EVERYONE COUNTS

The Occupancy monitor gives a real-time overview of the number of people present within the company.

Places in the office can be reserved in order to plan and organize telework / office work in advance.

With this user-friendly module even the access to the company can be controlled by informing the employees in advance and on the spot. To ensure that the maximum number of people will not exceed, specific office parameters can be determined, allowing to take infection prevention measures (for e.g. COVID-19) into account.

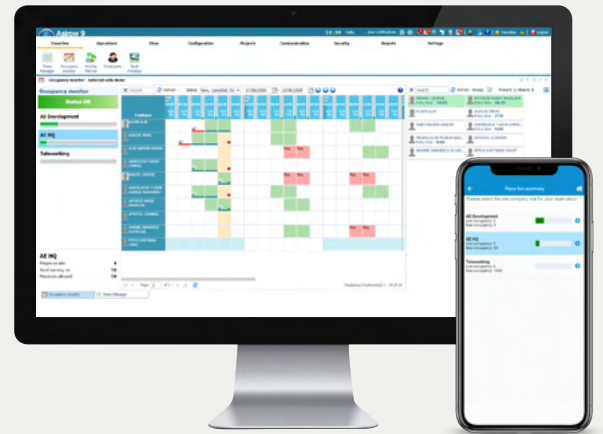

- ✓ Monitoring occupancy levels on different sites within the company
- ✓ Keep it safe for employees and visitors
- ✓ Optimise office spaces

## OCCUPANCY MONITOR

This central screen shows all the important information in one glance. A real-time overview of the current occupancy rate within the company. It even shows extensive information per site with thresholds and alerts according to the parameters set.

Planning of the use of office space is possible through the employee reservations. Managers can approve / reject a request based on the current & future information. Notifications from the system when thresholds are nearly reached will keep them informed at all times.

The parameters and thresholds are changeable and can be altered continuously depending on the current infection prevention measures or the number of available places.

## RESERVE A WORKPLACE

Employees submit an application to reserve their workplace for a specific site within the company and day with start time & end time. They can also add a comment to the request. This request is checked with the specified parameters in the system before it goes to the manager for approval.

Optimized for use on mobile phone and bespoke interface for web users.

## OFFICE OPTIMIZATIONS

The occupancy monitor helps with the various optimizations for office spaces. For example, employees reserve their office space or even a meeting room when they come to work at the office. With infection prevention measures in place and costs for facilities that keep rising, office spaces have become more limited. Ensuring that every employee has a desk, is supported by the occupancy monitoring. Businesses can also use this monitor to assess whether all crucial services (reception, support, ...) in the office have been filled. On the other hand, telework is becoming the new way of working more and more. Employees perform their work activities outside of a central work location. This allows for optimization of the facilities, even costs can be reduced by adapting to this new standard.

## ST25 Time management terminal

Every presence at the office (employees and visitors) must be registered, for standard Time & Attendance calculations. The ST25 time management terminal will verify the booking in the system. When this can be linked to a reservation, this planned presence will be converted to a confirmed presence. An unplanned attendance can also be allowed if the thresholds aren't reached. Clear messages to the employee, both visual and auditive, guide the employees to possible and appropriate actions.
